

- Accelerates Business Integration Projects.
- Reduces the implementation risk.
- Easily integrates complex systems.

VC@SOFT SCA Bridge is an acceleration tool that integrates enterprise applications into the orchestration environment of IBM Websphere Process Server™.

SCA Bridge allows customers that already have complex systems built with J2EE, .NET or PHP to integrate and orchestrate them as part of a process with IBM WebSphere Process Server, without having to rebuild them.

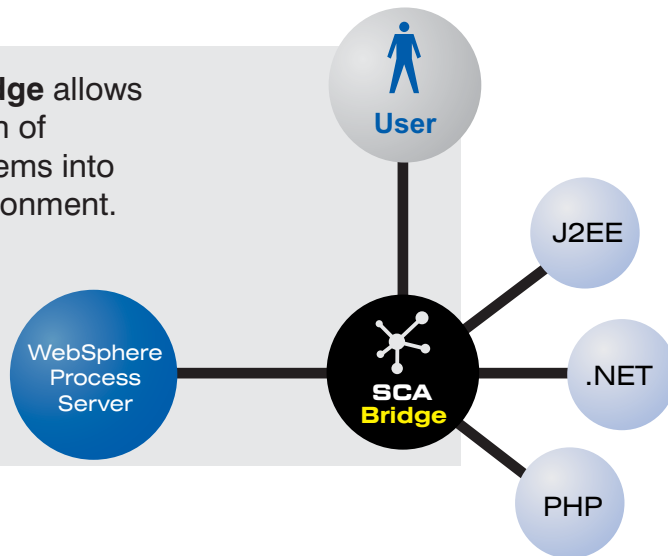

In order to incorporate these applications into the orchestration offered by IBM Websphere Process Server™ the Bridge models them as SCA components or BPEL activities.

SCA Bridge receives the required parameters from IBM Websphere Process Server™ and sends them to the existing application. The impact on the existing applications is minimal since the communication with SCA Bridge can be achieved in several non-intrusive ways.

The purpose of SCA Bridge is to allow the interaction of applications that could hardly be migrated into a SOA environment with the controlled environment of IBM Websphere Process Server™.

With SCA Bridge you get the most value out of your IBM investment!

The SCA Bridge allows the integration of complex systems into the SCA environment.
