Human Task JSP Generator

- Automates Web user interfaces generation.
- Reduces implementation time.
- Accelerates IBM WebSphere Process Server Projets.

VC@SOFT Human Task JSP generator is an Eclipse plug-in that integrates with IBM Websphere Integration Developer™ and allows the automatic generation of Web interfaces for Human Task activities in a BPEL process.

The **Human Task JSP Generator** tool allows the mapping of process data types to different HTML renderers. These renderers can be configured to extract their content from dynamic sources so the information in a BPEL process can be easily associated with any system within the company such as ERPs, databases or web services. The generated Web user interface can be modified in order to provide specific functionality that can't be generated automatically.

VC@SOFT Human Task JSP Generator reduces the time and complexity of IBM WebSphere Process Server™ projects that contain a great number of human task activities.

Don't waste valuable time writing JSP pages by hand!
